Research Interests

Distributed Systems, Testbeds, and Network Measurement: Design, development, and deployment of scalable, resilient, and secure distributed computing and communication systems across heterogeneous compute, storage, and wireless platforms, including building prototypes and testbeds, and performing real-world network measurements for evaluating and optimizing system performance, reliability, fault-tolerance, and security.

Next Generation Wireless Networks: Experimental design, evaluation, and deployment of real-world wireless and distributed system testbeds for 5G and beyond, and Open Radio Access Networks (Open RAN), wireless mesh networks, and satellite networks.

Software Defined Wireless Networks and Internet of Things (IoT): Modeling and implementation of Software Defined Networking (SDN)-based approaches in wireless systems (including wireless mesh networks, delay/disruption tolerant networks, and sensor networks) and building lightweight solutions (such as blockchain-based frameworks for IoT) to support emerging applications.

Complex Network Analysis for Applied Systems: Applying complex network tools to analyze practical systems such as road networks and intelligent transportation systems, enabling the design and development of mobility models, routing protocols, and security frameworks.

Systems Security: Analysis of security threats and attacks on Software Defined Networking (SDN) architectures, and the design and implementation of practical defense mechanisms to ensure reliability and resilience.

Software Developed

1. OpenFlow Software Switch with Controlled Buffering

OBJECTIVE: Enable an SDN switch capable of controlled buffering of packets in order handle link disruptions in software defined wireless environments.

2. Software Defined Optimized Link State Routing (SD-OLSR) Protocol

OBJECTIVE: Provide an automated SDN resource discovery and self-configuration scheme for software defined wireless environments involving mobile switches and controllers.

3. Urban Delay Tolerant Network Simulator (UDTNSim)

URL: <https://github.com/4sarathbabu/UDTNSim>

OBJECTIVE: Design and develop mobility models and routing protocols for ad hoc vehicular networks in real-world road network environments and analyze the performance.
